

Baylor College of Medicine

The General Psychiatry Residency Program at the Baylor College of Medicine Menninger Department of Psychiatry and Behavioral Sciences strives to produce academic and clinical leaders through the administration of coordinated and progressively sophisticated didactic, clinical, supervisory, and mentorship experiences. This allows residents to achieve competence across the bio-psycho-social-spiritual understanding and treatment of neuropsychiatric disorders. Residents are supported to achieve the adaptability, knowledge, abilities, and experience to meet the needs of any community across any setting by faculty with specific expertise in these areas. Clinical experiences provide a firm foundation of primary care and neurology for all incoming trainees, while the breadth of the psychiatry curriculum establishes a balanced psychotherapy foundation. Training opportunities encompass various medical systems and models of care, while patients represent the range of the socioeconomic and demographic continuum. Affiliations include a public county hospital system, private pediatric hospital, private adult hospital with an in-patient center, a large Veteran's facility, community and subspecialty hospital-based clinics, the Center for Psychoanalytic Studies, the McNair Mind/Brain research foundation, and the Institute for Spirituality and Health. Baylor residents strive for excellence demonstrating professionalism, diversity, wellness, life-long learning, and quality improvement. Program graduates demonstrate broad clinical and psychotherapeutic skills, subspecialty focus, and an ability to serve as consultants to a care team; prepared for ABPN certification and committed to excellence in patient care delivered in their system.
