

University of Massachusetts Medical School Integrated Adult/Child Psychiatry & General Psychiatry

The mission of the Psychiatry Residency Program is to educate and train knowledgeable residents, informed in the broad range of neurobiological, psychotherapeutic, social, cultural and rehabilitative perspectives. We are dedicated to the training of psychiatrists who serve their communities by engaging in research and providing compassionate, person and family-driven, trauma-informed, recovery-focused, respectful care and advocacy for those in need of mental health services.

The Division of Child and Adolescent Psychiatry has a close relationship with the UMass Department of Pediatrics, significantly enhancing the quality of the pediatric consultation-liaison and infant/preschool psychiatry experiences. Specialty experiences occur in a variety of nearby community settings, including day care, schools, courts, and juvenile corrections.

The residency in Child and Adolescent Psychiatry is strongly supported by the Department of Psychiatry and UMass Memorial Health Care, its clinical partner. Resident salaries are very competitive with other programs and include an excellent benefits package. All the clinical rotations are carefully chosen to maximize educational value to our fellows, rather than to fill clinical service needs.
