

University of Colorado School of Medicine

Our training program is built on a deep tradition in psychotherapy, cultural awareness, and community engagement that have always been part of psychiatry's foundation, while at the same time incorporating evolving developments in molecular, neuronal, and genetic aspects of brain function. The faculty of the Department of Psychiatry are dedicated to training you, bringing the latest scientific evidence, clinical models, and technology to understand and treat mental illnesses. Faculty who lead nationally known programs in substance abuse, reproductive psychiatry, neuropsychiatry, neuro-imaging, molecular genetics, psychopharmacology, refugee mental health, LGBTQ mental health, infant and early childhood development, integrated care, forensics, tele-psychiatry, psychoanalysis, and mood disorders are integrated into residents' clinical rotations and scholarly experiences. This rich tapestry of experiences and expertise helps trainees identify and explore their passions.

Our unique program offers diverse clinical experiences at University of Colorado Hospital, Denver Health Medical Center, the Denver Veterans Administration Medical Center, Children's Hospital Colorado, and other training settings throughout our community.
