

Duke Internal Medicine–Psychiatry Residency Training Program

The Duke Medicine Psychiatry Residency Training Program trains a diverse group of physicians to be excellent, compassionate, inquisitive and well-rounded clinicians who are experts at the behavioral and medical manifestations of illness and knowledgeable about pathophysiology and mechanisms of disease, including biological, behavioral and social drivers of health. Duke's combined residency program in Internal Medicine–Psychiatry has been in existence for over two decades and provides rigorous and excellent training in each specialty while fostering our trainees' growth and development into outstanding physicians who are skilled at providing, advocating for, improving, and studying holistic healthcare. Our residents benefit from full membership in each department as well as from the input and involvement of a large number of combined-trained faculty. Our trainees round on the combined Medicine–Psychiatry service (known as "Gen Med 12") during every year of training, meet regularly to discuss professional identity formation, and convene weekly during Med–Psych conference. We have created opportunities for resident–faculty discussions during monthly "Journal Clubs," currently held via Zoom, and are proud of and grateful for our close-knit community of trainees and combined-trained physicians.
